

Redacted Security Automation Portfolio Summary

Elias Leslie • [linkedin.com/in/elias-leslie](https://www.linkedin.com/in/elias-leslie)

This summary outlines capabilities and outcomes from security tooling and automation I've built or led. It intentionally avoids proprietary names and code. The focus is on defensive operations, portability, and measurable results.

Capability Map (high level)

- Incident response & containment: multi-module host isolation with safe exceptions and rapid rollback; bulk credential reset runbooks.
- Detection engineering: high-signal rules and dashboards for endpoint/identity/network telemetry; replay/testing harnesses for rapid tuning.
- Compliance automation: ~500+ CIS-aligned checks, phased deployment (transparent → disruptive), evidence/attestation exports (HTML/CSV/JSON).
- Forensics & timelines: automated artifact collection across Windows sources with risk scoring and interactive, shareable reports.
- RMM/MDM-agnostic deployment: universal wrappers, staged rollouts, health checks, and self-healing via auto-repair.
- Security tool monitoring: multi-vendor health validation for services/processes/config with registry/state reporting.
- Threat intel workflows: IOC reputation checks and hunt exports for SIEM/BI pipelines.
- AI-assisted engineering: agentic workflows to draft modules/tests and adversarial validation before release.
- Credential hygiene: safe, staged credential rotation including KRBTGT reset workflows.
- Endpoint resilience: Windows update remediation/repair with guardrails and health validation.

Representative Modules

- net-isolate (containment), triage-lite/full (evidence capture), ioc-hunt (IOC sweeps), timeline-build (forensics), xdr-rules-host (detections).
- cis-pack (control checks & evidence), deploy-universal (portable deployment), tool-monitor (health), update-repair (OS update remediation).

Architecture & Quality

- Modular, testable, idempotent with clear inputs/outputs and schemas.
- Quality gates: unit tests, canary rollouts, synthetic attack replays, performance/stability thresholds.
- Observability: structured logs, health dashboards, automatic rollback on failure signals.
- Security: code signing, least-privilege execution, secure temp/storage, tamper checks.

Outcomes (selected)

- Material incident reduction through preventive controls and higher-fidelity alerting.
- Faster incident response via one-click containment and standardized triage/timelines.
- Audit acceleration and sustained compliance through automated evidence and control status reporting.
- Portability and resilience by removing vendor lock-in with RMM/MDM/CLI deployment patterns.
